rodent behavioral testing has been used to study brain functions since the 1890s and has become a gold standard model in modern neuroscience up to the 1950s most behavioral tests on laboratory rodent models were based on punishments and rewards both approaches can lead to a certain degree of animal pain or suffering punishments involved the employment of painful stimuli typically electric shocks passive avoidance and fear conditioning tests among the most widely used behavioral paradigms used to evaluate learning and memory in rodents can be performed using only a single brief shock other tests such as the active avoidance might require up to tens or hundreds of shocks strongly challenging the psychological welfare of the model animals on the other hand tests based on rewards which apparently may seem more ethical actually still induce suffering in the animals as food rewards are almost always associated with a food restriction protocol in order to motivate food seeking behavior rodents are starved for days before starting the test and kept under food restriction for the whole duration of the test the distress during the testing session is only a minimal part compared to the stress lived outside of the testing session which is prolonged and continuous analogously liquid rewards commonly rely on a previous water restriction protocol to use thirst as motivation animal stress is not only an ethical issue per se but also an important factor potentially impacting on the reliability and reproducibility of experimental results

thyroid function tests are utilized by essentially all medical practitioners across every clinical setting in patients from newborns to the elderly they are the most frequently measured endocrine tests the sensitive thyrotropin tsh assay reflects thyroid hormone feedback to the pituitary and is diagnostic of both thyroid h mone excess as well as deficiency the log linear relationship between serum tsh and thyroxine concentrations means that small changes in serum thyroxine are amplified by changes in serum tsh the availability of the sensitive tsh assay in essentially all clinical laboratories has improved and simplified the assessment of thyroid function for the diagnosis of thyroid disease and to monitor treatment serum free thyroxine and thyrotropin concentrations as well as other thyroid tests can be measured utilizing an automated immunoassay platform that provides rapid and accurate results this simplified approach to thyroid assessment often requ ing only a serum tsh measurement and rapid availability of the thyroid function tests results has expanded the scope of thyroid testing and clinicians ordering and interpretingh yroid tests there remain however many challenges in selecting the appropriate thyroid function test to order the correct interpretation of results and applying these results to the diagnosis and management of

thyroid diseases it is especially important to be aware of limitations of thyroid function tests as well as special clinical circumstances that can influence thyroid function measurements the serum tsh concentration for example may not accurately reflect thyroid status in many situations including after prolonged hyperthyroidism when serum tsh remains suppressed for months in the presence of hypothalamic or pituitary disease or due to a number of interfering medications the serum free thyroxine measured by the analog method is not accurate with high or low serum binding proteins and during pregnancy hospitalized patients often have thyroid function test abnormalities that are transient and return to normal after recovery from the acute illness iodine excess and deficiency can dramatically influence thyroid function tests significant insights have been gained into the regulation of thyroid hormone synthesis and especially the role of thyroid hormone metabolism in supplying tissues locally with an adequate supply of thyroid hormone in a number of instances these factors influence the selection and interpretation of thyroid function tests polymorphisms common sequence variations in genes of components that regulate thyroid function and thyroid hormone action may also contribute to variability in thyroid function tests in a population

vii preface this volume draws on an outstanding international panel of experts in thyroid function tests and thyroid function assessment they represent clinicians clinical researchers and basic science researchers all with a focus on some aspect of the assessment of thyroid function the chapters all provide a clinical perspective but are informed by the most recent scientific advancements the first section of the book chapters 1-3 presents the most recent advances in thyroid physiology a review of genetic influences on thyroid function tests and a discussion on the influence of iodine on thyroid function in chapter 1 drs huang and de castro neves describe thyroid hormone metabolism emphasizing the key role of thyroid hormone activation and inactivation in thyroid hormone action dr visser is a world leader in studies of thyroid metabolism and genetic influences on thyroid function in chapter 2 dr visser and his colleagues drs van der deure medici and peeters provide a clear view of this important and rapidly expanding field the population variation in the tsh set point relationship between serum tsh and thyroxine in an individual for example is thought to be genetically determined and influences the evaluation of thyroid function and thyroid function targets for treatment of thyroid disease dr zimmerman an internationally recognized expert in iodine and his colleague dr andersson provide in chapter 3 an in depth treatment of the most significant influence on thyroid function throughout the world iodine intake the influence of iodine deficiency and excess on individual thyroid function is discussed as well as the population effects on thyroid diseases and especially fetal and neonatal development the basics of thyroid function measurements approaches limitations and clinical applications are described for the major categories of thyroid function tests chapters 4-7 the authors of these chapters are innovators in the field strongly identified with the origination or significant refinement of the core tests utilized in thyroid assessment in chapter 4 dr hershman describes the measurement of tsh the clinical application and utilization this remains the cornerstone of thyroid testing but must be interpreted with an understanding of the dynamics of thyroid regulation an active controversy in thyroid measurement involves the appropriate use of serum thyroxine measurements and especially the value of the analog free thyroxine measurement the most commonly used thyroxine assay in chapter 5 dr stockigt provides a detailed assessment of thyroxine and triiodothyronine measurements and a clear message for their use and limitations the most common etiology of thyroid disease is autoimmune and the appropriate use of thyroid autoantibody measurements remains confusing to many clinicians in chapter 6 dr weetman and his colleague dr aijan clearly describe the range of thyroid autoantibody tests and how they should be utilized clinically thyroglobulin measurement is the key tumor marker to follow thyroid cancer patients and dr spencer and her colleague ivana petrovic describe the essential features of this measurement in chapter 7 it is essential that clinicians using thyroglobulin measurements to monitor thyroid cancer are aware of the performance of the assay being used and the factors that can interfere with the measurement application of thyroid function testing to the key clinical settings is discussed by expert clinicians and clinical researchers in chapters 8-13 the appropriate selection of thyroid function tests in the diagnosis and monitoring of thyroid disease in the ambulatory setting is discussed by drs farwell and leung in chapter 8 this is the most common setting for thyroid function test measurement and a rational approach is described specific issues of thyroid function in infants and children are discussed in chapter 9 by drs lafranchi and balogh screening for thyroid disease among newborns has been a highly effective approach to prevent mental retardation the assessment of thyroid function in newborns especially premature infants is challenging as are the interpretation of thyroid function tests in infancy through childhood illness has a significant impact on thyroid function tests and assessment in this group is described by drs lopresti and patil in chapter 10 a logical approach to these patients is provided as are ways to identify those patients with thyroid disease that need to be

treated assessment of thyroid function in pregnancy is challenging and is being increasingly recognized as a crucial time to normalize maternal thyroid status adverse outcome for mother and her child can result from thyroid hormone deficiency or excess in chap 11 Drs Lazarus Soldin and Evans fully describe the use and limitations of thyroid tests in pregnancy and provide an approach to testing and monitoring thyroid function the incidence of autoimmune thyroid disease increases significantly with age and in chap 12 Dr Samuels provides a clear approach to the assessment of thyroid status in the elderly and interpretation of thyroid studies the influence of drugs on thyroid function testing remains a major clinical issue with recognition of an ever increasing list of medications that influence thyroid function and thyroid testing in chap 13 Drs Pearce and Ananthakrishnan comprehensively describe these medications with a special emphasis on their mechanism of action and on iodine containing medications I am most grateful to my colleagues for their enthusiasm and willingness to provide such outstanding contributions to this book the editorial team at Springer is excellent and has been highly supportive and effective my special thanks to Editor Laura Walsh Associate Editor Dianne Wuori Editorial Assistant Stacy Lazar Senior Production Editor Jenny Wolkowicki and Crest Premedia Solutions for final production

downscaled physical models also referred to as subscale models have played an essential role in the investigation of the complex physics of flight until the recent disruption of numerical simulation despite the fact that improvements in computational methods are slowly pushing experimental techniques towards a secondary role as verification or calibration tools real world testing of physical prototypes still provides an unmatched confidence physical models are very effective at revealing issues that are sometimes not correctly identified in the virtual domain and hence

can be a valuable complement to other design tools but traditional wind tunnel testing cannot always meet all of the requirements of modern aeronautical research and development it is nowadays too expensive to use these scarce facilities to explore different design iterations during the initial stages of aircraft development or to experiment with new and immature technologies testing of free flight subscale models referred to as subscale flight testing sft could offer an affordable and low risk alternative for complementing conventional techniques with both qualitative and quantitative information the miniaturisation of mechatronic systems the advances in rapid prototyping techniques and power storage as well as new manufacturing methods currently enable the development of sophisticated test objects at scales that were impractical some decades ago moreover the recent boom in the commercial drone industry has driven a quick development of specialised electronics and sensors which offer nowadays surprising capabilities at competitive prices these recent technological disruptions have significantly altered the cost benefit function of sft and it is necessary to re evaluate its potential in the contemporary aircraft development context this thesis aims to increase the comprehension and knowledge of the sft method in order to define a practical framework for its use in aircraft design focusing on low cost short time solutions that don t require more than a small organization and few resources this objective is approached from a theoretical point of view by means of an analysis of the physical and practical limitations of the scaling laws and from an empirical point of view by means of field experiments aimed at identifying practical needs for equipment methods and tools a low cost data acquisition system is developed and tested a novel method for semi automated flight testing in small airspaces is proposed a set of tools for analysis and visualisation of flight data is presented and it is also demonstrated that it is possible to explore and demonstrate new technology using sft with a very limited amount of economic and human resources all these together with a theoretical review and contextualisation contribute to increasing the comprehension and knowledge of the sft method in general and its potential applications in aircraft conceptual design in particular
