as is apparent from the table of contents the lectures at the third course of the international school of applied geophysics erice march 27 april 4 1980 the first part of this volume dealt with several applications of inversion to different geophysical methods for every field the more general lectures come first followed by those aimed at more specialized objectives not all topics are covered and the coverage is not uniform the seismological section especially the seismic reflection methods is the most developed and this is only partly due to the actual state of the art unfortunately only abstracts are available for two of the lectures the second part of the volume contains some short notes and contributions presented either by the lecturers themselves or by other participants they do not necessarily

deal with the process of inversion itself but with the preparation and meaning of the data to be inverted or with some original treatments of problems that were discussed in the afternoon sessions the discussion sessions and the round table that followed the lectures were essential to the success of the course and to an understanding of the different perspectives of the various specialists i hope that the group of very brilliant and willing geophysicists that made the meeting so interesting will stay in touch grow closer and meet again close scientific cooperation among them could contribute much to the unification of geophysical science

this reference manual is designed to enable more geophysicists to appreciate static corrections especially their limitations their relationship with near surface geology and their impact on the quality of final interpreted sections the book is addressed to those involved in data acquisition datum static corrections data processing datum static and residual static corrections and interpretation the impact that unresolved static corrections especially the long wavelength or low spatial frequency component have on the interpretation of the final section simple explanations of the underlying principles are included in an attempt to remove some of the mystique of static corrections the principles involved are illustrated with simple models these are supplemented with many data examples this book details

differences in approaches that must be considered among 2d 3d and crooked line recordings as well as between p wave and s wave surveys static corrections are shown to be a simplified yet practical approach to modeling the effects of the near surface where a more correct wavefield or raypath modeled method may not be efficiently undertaken chapters cover near surface topography and geology computation of datum static corrections uphole surveys refraction surveys static corrections limitations and effect on seismic data processes residual static corrections and interpretation aspects an extensive index and a large list of references are included

this book is written for advanced earth science students geologists petroleum engineers and others who want to get quickly up to speed on the interpretation of reflection seismic data it is a development of material given to students on the msc course in petroleum geology at aberdeen university and takes the form of a course manual rather than a systematic textbook it can be used as a self contained course for individual study or as the basis for a class programme the book clarifies those aspects of the subject that students tend to find difficult and provides insights through practical tutorials which aim to reinforce and deepen understanding of key topics and provide the reader with a measure of feedback on progress some tutorials may only involve drawing simple diagrams but many are computer aided pc based with graphics output to give insight into key steps in seismic data processing or into the seismic response of some common geological scenarios part i of the book covers basic ideas and it ends with two

tutorials in 2 d structural interpretation part ii concentrates on the current seismic reflection contribution to reservoir studies based on 3 d data

this second volume of papers on thomas harriot edited by professor robert fox is based on the annual harriot lectures delivered at oriel college oxford between 2000 and 2009 it complements the previous volume published as thomas harriot an elizabethan man of science in 2000 the focus in several of the papers is on harriot's outstanding achievements as a mathematician others consider why he has never received the recognition accorded to his great contemporary galileo others again examine his association with his entrepreneurial patron walter raleigh and his contributions to the intensely practical world of exploration and seamanship as exemplified in his voyage to the

coast of present day north carolina in 1585 the volume adds significantly to our understanding of a true renaissance man who wrote accomplished latin earned the respect of europe s leading mathematicians and astronomers and moved easily in circles close to the english court and whose brief and true report of the new found land of virginia 1588 was the first detailed description of america to be published in the english language
